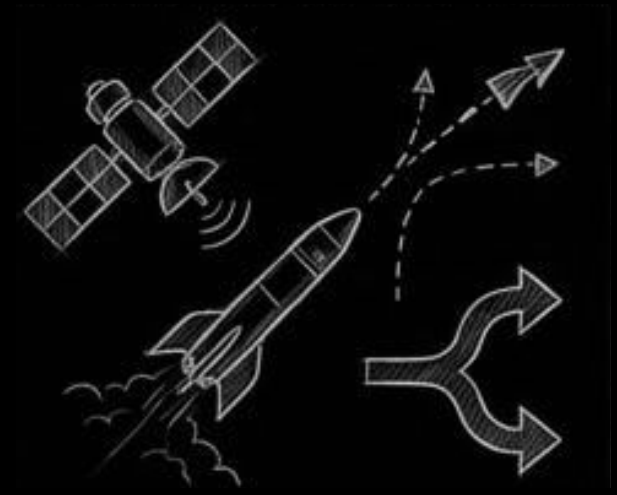
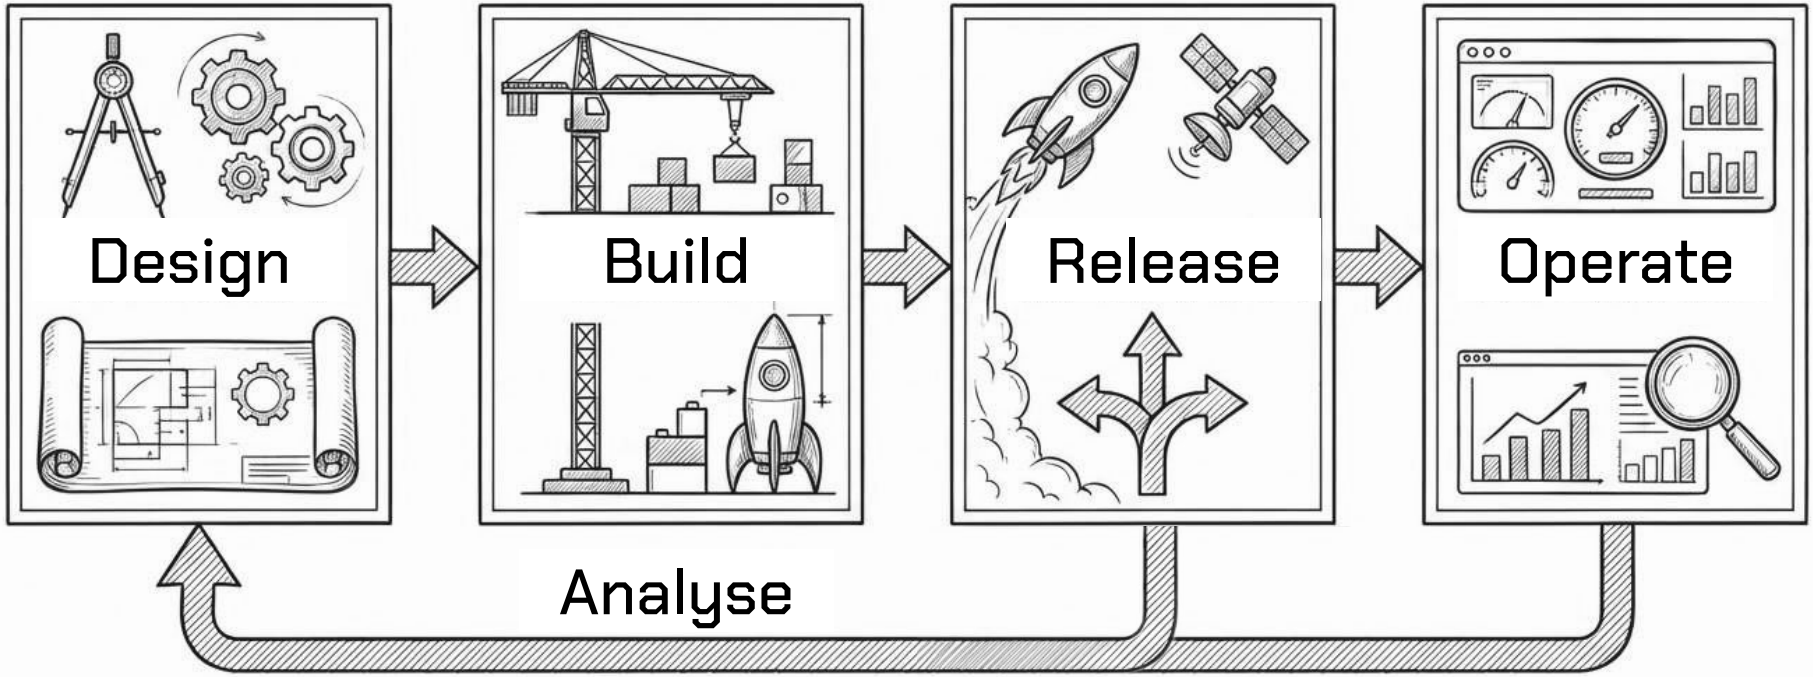
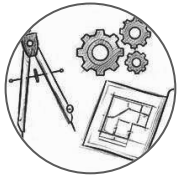
Performance Culture

February 2026



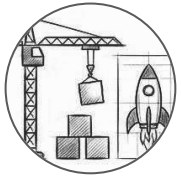
Performance is embedded throughout the Product Life cycle





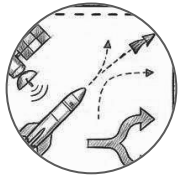
Design as a learning system, not a one-off solution

What?	Why?
Hypothesis Driven	*Intent on top of intuition*. It forces clarity on *what problem we're solving*, a defined opportunity space for the solution and *what change we expect to see.*
Clear KPIs	*How we'll know if it worked*, start with behavioural KPIs and move upwards to topline KPIs. Together with the hypothesis creates alignment and constraints.
Built for flexibility	*Server-side configuration and swappable tech art bundles*. Reduces 'lock-in' risk, enables Plan B and more testing, frees the dev team in the mid-long term.
Built holistically, not in isolation	*Not designing a feature, designing an experience* and thinking in advance how it connects to the entire system (Economy, Calendar, Content Cadence).
Analytics to answer business questions	*Make sure we know what are the important questions* so later we're able to answer them.



Agile in execution, committed to delivery

What?	Why?
RAT/MVP approach	Prioritise time-to-player and learnings over perfect. Start with minimal investment, uncovering critical insights early and reducing uncertainty.
Clear Timelines, Clear Priority	Spend time estimating efforts, building a phased release plan. Commit to the timelines and communicate and delays / descoping. Be ready to prioritise what's important and move away from all or nothing.
Clear Ownership	Have a clear product owner to answer any questions that arise during the development process and prioritise changes.
Feedback Early and often	Communicate what's final and what's WIP, collect focused feedback through a single owner and be ready to iterate on the go.



Scale confidently with Insights

What?	Why?
Phased and goal based rollout	Get performance signals and watch guardrails, have time to iterate on both quantitative and qualitative data; Don’t compromise on ambition level.
AB Test and optimise by default	No more fingers crossed. Know what to expect when going global and test multiple hypotheses. Set mindspace time aside for iterations.
Measure Impact	The monitoring tools and capacity are an inseparable part of the release, without monitoring we are blind. Measure impact objectively against hypothesis
Go-to-market Strategy	Connect releases to other parts of the game - marketing, calendar and have an holistic impact
Stakeholder Management	Make sure the team is aware of the goals and investments required. Be ready to cheerlead and hype the team or clarify when we’re firefighting.

Play the Long Game, Maximise Player Engagement and Business Impact

What?	Why?
Live Operability and Eventfulness	Create Variance in the game using flexible live operable features.
Monitor Long Term	Avoid novelty biases and sacrificing long term for short term gains, be ready to adapt as the ecosystem adapts. Provide clear visibility on metrics and targets.
Optimisation Plan and Goals	The work doesn’t end with global release, Challenge the status quo and revalidate the process and systems.. Know when to move to the next bet.
Experiment!	Turn assumptions into data, learn and make not only the current but also the next developments better. Don’t call it failure, continue working on it!
Holistic Operations	Work alongside marketing and community to maximise impact
